[Lost and Found](#) Apr 29 2020 On a bright autumn day, Flynn Marlowe lost his best friend, a beagle named Barley, while out on a hike in Seattle's Discovery Park. On a cold winter day, Mac Bowersox found his best friend, a lost, scared, and emaciated beagle, on the streets of Seattle. Two men. One dog. When Flynn and Mac meet by chance in a park the next summer, there's a problem -- who does Barley really belong to? Flynn wants him back, but he can see that Mac rescued him and loves him just as much as he does. Mac wants to keep the dog, and he can imagine how heartbreaking losing him would be -- but that's just what Flynn experienced. A "shared custody" compromise might be just the way to work things out. But will the arrangement be successful? Mac and Flynn are willing to try it ... and along the way, they just might fall in love. The paperback edition includes the story, "I Heart Boston Terriers." Love at first sight can work for dogs as well as humans. When Aaron finds Mavis, an emaciated and timid Boston terrier, at a pet adoption fair, his heart goes out to her -- irrevocably. When Christian, who is manning the adoption fair for the Humane Society that fateful autumn Saturday, finds Aaron, his heart goes out to him -- irrevocably.

[The Structural Basis of Muscular Contraction](#) Apr 22 2022 Muscular contraction provides one of the most fascinating topics for a biophysicist to study. Although muscle comprises a molecular machine whereby chemical energy is converted to mechanical work, its action

in producing force is something that is readily observable in everyday life, a feature that does not apply to most other structures of biophysical interest. In addition, muscle is so beautifully organized at the microscopic level that those important structural probes, electron microscopy (with the associated image analysis methods) and X-ray diffraction, have provided a wealth of information about the arrangements of the constituent proteins in a variety of muscle types. But, despite all this, the answer to the question "How does muscle work?" is still uncertain, especially with regard to the molecular events by which force is actually generated, and the question remains one of the major unsolved problems in biology. With this problem in mind, this book has been written to collect together the available evidence on the structures of the muscle filaments and on their arrangements in different muscle cells, to extract the common structural features of these cells, and thus to attempt to define a possible series of mechanical steps that will describe at molecular resolution the process by which force is generated. The book cannot be considered to be an introductory text; in fact, it presents a very detailed account of muscle structure as gleaned mainly from electron microscopy and X-ray diffraction.

**The Peptidergic Neuron** Sep 27 2022 Neuropeptides rank among the phylogenetically oldest interneuronal signal substances. In the concept of neuro-secretion they were identified as neurohormones by which - via the blood - the brain regulates peripheral functions. It is now evident that the neuropeptides act as neurotransmitters/-modulators, as (neuro-)hormones, and paracrine or autocrine signal substances in diverse parts of the body. This book reviews, in several comprehensive articles written by distinguished specialists, the state of the art in the field of neuropeptides and peptidergic neurons. Special topics concern molecular aspects of processing, release and degradation of neuropeptides, receptors and signal transduction, comparative and behavioural aspects, and immunoregulatory effects of neuropeptides and their involvement on pathology of the central nervous system.
