**School Is A Joke** Mar 26 2022 School Is a Joke: Ethnography of Inner City Public School Students' Perception and Sensemaking of School and Schooling explored minority and low-SES inner-city high school students' perception and sense-making of school, schooling, learning, academic behaviors, and academic achievement through an integrated theory of human development, learning, and achievement. The author sought an understanding of the reason behind the persistent academic failure of inner-city minority and low-SES high school students, as well as the academic achievement gap within and between this subgroup of students. Conducted in a high-poverty, high-minority comprehensive inner-city high school in the south of the United States of America, the aim of the study was threefold. First, the author explored the factors operating in high school students' thoughts, feelings, actions, and reactions to school and academic achievement. Second, she examined the mechanisms by which these factors operate. Third, she utilized an integrated humanistic paradigm in analyzing student learning and academic behavior, the interaction between student characteristics and school processes, and the school culture that emerged from the interaction. The integrated framework for the study comprised of Bronfenbrenner's bioecological model of human development, Bandura's sociocoginity theory of learning, and Bourdieu's concept of habitus. The study's findings have implication for student learning, academic behavior, and academic achievement; school organization and functioning, as well as administrative behavior and school culture.

**Nature of Prominences and their Role in Space Weather (IAU S300)** Jan 24 2022 Solar prominences and filaments are large gaseous features extending outward hundreds of thousands of kilometres from the Sun's surface, which play an active role in space weather. Magnetic clouds and interplanetary coronal mass ejections associated with erupting prominences can produce severe perturbations in the Earth's near-space environment. IAU Symposium 300 presents a review of the state-of-the-art theoretical and numerical modelling of prominences and filaments, and their role in the dynamics of Sun-Earth relations. Observations from the latest international space-borne missions (Hinode, STEREO and SDO) and ground-based observatories are presented. The Symposium benefits not just newcomers to solar physics research but it shares the current status of our sophisticated solar analysis with the stellar community, now that huge prominences and CMEs have been detected in solar-type stars, and others, which will affect any exoplanets they host.

**Putin's Master Plan** Apr 02 2020 Vladimir Putin has a master plan to destroy Europe, divide NATO, reclaim Russian influence in the world, and most of all to marginalize the United States and the West in order to achieve regional hegemony and global power. Putin's unified strategy and vision for Europe has not been thoroughly discussed or articulated in any meaningful way until now. Putin's Master Plan is the first comprehensive attempt to systematically explain Putin's global strategy, which could inevitably and inexorably lead to the breakup of the NATO alliance, and potentially to war with the West. Currently, the West has no strategy, no plan, and no tactics to confront Putin's master plan other than imposing limited economic sanctions, which have done little to deter Putin's aggression—and may well have encouraged and facilitated it. The viewpoint taken here is not just alarmism, but an accurate and, for the first time, clear and sober portrayal of a frightening situation that, more and more, serious observers of European and Russian politics are openly recognizing and acknowledging. Putin's Master Plan makes the case that it is essential to wake up to Putin's strategy to destroy Europe, divide NATO, and build a new empire in the former Soviet Union. Russia has demonstrated an extraordinary level of aggression, most boldly in its outright invasions of Georgia and Ukraine. American weakness and a divided Europe have left Russia's terrified neighbors without an alternative to Russian domination, and even once-stalwart American allies such as the Republic of Georgia are on the brink of becoming part of Putin's new empire in Europe. Putin has made it clear that he sees NATO expansion as a fundamental threat to Russian nationhood, and he is systematically challenging the NATO Alliance as well as the United States. So far, he is winning.

Applications of the Theory of Groups in Mechanics and Physics Jun 24 2019 The notion of group is fundamental in our days, not only in mathematics, but also in classical mechanics, electromagnetism, theory of relativity, quantum mechanics, theory of elementary particles, etc. This notion has developed during a century and this development is connected with the names of great mathematicians as E. Galois, A. L. Cauchy, C. F. Gauss, W. R. Hamilton, C. Jordan, S. Lie, E. Cartan, H. Weyl, E. Wigner, and of many others. In mathematics, as in other sciences, the simple and fertile ideas make their way with difficulty and slowly; however, this long history would have been of a minor interest, had the notion of group remained connected only with rather restricted domains of mathematics, those in which it occurred at the beginning. But at present, groups have invaded almost all mathematical disciplines, mechanics, the largest part of physics, of chemistry, etc. We may say, without exaggeration, that this is the most important idea that occurred in mathematics since the invention of infinitesimal calculus; indeed, the notion of group expresses, in a precise and operational form, the vague and universal ideas of regularity and symmetry. The notion of group led to a profound understanding of the character of the laws which govern natural phenomena, permitting to formulate new laws, correcting certain inadequate formulations and providing unitary and non contradictory formulations for the investigated phenomena.

Nanopowders of Metal Oxides and Fluorides Nov 29 2019 One of the directions of nanotechnology is the production of nanopowders (NPs).

Nanopowders, according to the currently widely used classification of nanomaterials, belong to zero-dimensional systems in which the limitation of wave functions occurs in all three directions. Biological methods are considered the most environmentally friendly way to synthesize NPs, but the possibility of biological contamination with mutated microorganisms cannot be ruled out. This book presents a new method for producing simple and complex metal oxide and fluoride NPs, based on the "evaporation-condensation" process using pulsed electron beam evaporation. It presents the results of more than 10 years of study of the characteristics of NPs produced using the aforementioned method. This eco-friendly method ensures the production of clean NPs, which are mesoporous and suitable for use in various applications such as medicine, spintronics, optoelectronics, dosimeters, photocatalysis, semiconductors, and ultraviolet and blue lasers. Importantly, these NPs have the potential to be used as a drug delivery system and in the creation of new nanostructures that do not contain noble metals. The book will be useful for the researchers in macromolecular science, nanotechnology, chemistry, biology, and medicine, especially those with an interest in drug delivery or cancer therapy.

Regional Metamorphism of Ore Deposits and Genetic Implications Feb 22 2022 The unifying theme to the papers in this volume is that they deal with economic accumulations of sulfide minerals which, together with their host rocks, have been affected to varying degrees by regional metamorphism. The principle sulfide deposit types discussed are stratabound ZnCuPbAgBa deposits in regionally metamorphosed terranes which occur in a diverse variety of host lithologies. In addition other interesting deposit types are discussed and examples are presented from various parts of the world. The topics treated in this volume are: the interaction of sulfide minerals with their host rocks during regional metamorphism; the quantitative interpretation of P-T-time histories of regional metamorphism in which both sulfide and silicate phase relations must be considered together in order to meaningfully interpret the metamorphic history; the question of how to identify progenitors of rocks modified by tectonic and metamorphic processes and the implications of these studies; developing future exploration strategies for massive sulfide deposits in metamorphic terranes.

**Shear Strengthening of T-beam with GFRP** Jun 16 2021 This book presents a systematic approach to the experimental, theoretical, and numerical investigation of reinforced concrete (RC) T-beams strengthened in shear with glass-fibre-reinforced polymers (GFRP) with variation in transverse steel reinforcements. It discusses experiments conducted on simply supported RC T-beams for control beams with and without transverse steel reinforcements and beams strengthened in shear with GFRP sheets and strips in different configurations, orientations, and variation of layers for each type of stirrup spacing. The book also includes a detailed numerical study using ANSYS performed in two stages. The first stage consists of selecting and testing relevant materials in the laboratory to establish the physical and mechanical properties of the materials. The second stage then involves testing beams for shear under two-point static loading systems. The test results demonstrate the advantage of using an externally applied, epoxy-bonded GFRP sheets and strips to increase the shear capacity of the beams. The finite element method (FEM) analysis results verify the experimental results. The book will serve as a valuable resource for researchers and practicing civil engineers alike.
